Features

- Refine and slim body design
- LED display for real time monitoring (control input, load voltage, load current, load power, load resistance and heatsink temperature) and checking parameter settings
- Stable control by feedback control (constantcurrent/constant voltage/constant power control)
- Communication output model available: RS485 (Modbus RTU method)
- Convenient parameter settings via PC (RS485 communication)
 : Free download the comprehensive device management program (DAQMaster)
- Various alarm functions (alarm output)
 : overcurrent, overvoltage, heatsink overheat, fuse break, SCR error
- · Easy installation of the bracket
- Simple fuse replacement structure for easy maintenance
- Interphase insulating barrier included SPR series
- Highly reliable SCR (IXYS) element

NEW

Manual

- For the detail information and instructions, please refer to user manual for communication, and be sure to follow cautions written in the technical descriptions (catalog, homepage). Visit our homepage (www.autonics.com) to download manuals.
- User manual for communication manual describes for RS485 communication (Modbus RTU protocol) and parameter address map data.

Comprehensive Device Management Program (DAQMaster)

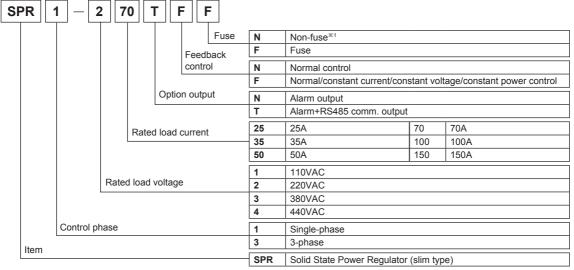

- DAQMaster is a comprehensive device management software for setting parameters and monitoring processes.
- Visit our website (www.autonics.com) to download user manual and comprehensive device management program.
- < Computer specification for using software >

< DAQMaster screen >

Item Minimum specifications System IBM PC compatible computer with Pentium III or above Operations Windows 98/NT/XP/Vista/7/8/10 Memory 256MB+ Hard disk 1GB+ of available hard disk space VGA Resolution: 1024×768 or higher Others RS232C serial port (9-pin), USB port

Ordering Information

※1: Product is not equipped with a rapid fuse inside. Install the suitable fuse for rated load current of the model separately. (The performance of the product is guaranteed only when using the fuse provided by us.)

SPR1/SPR3 Series

Unit Description

- ① Bracket
- ② Indicator

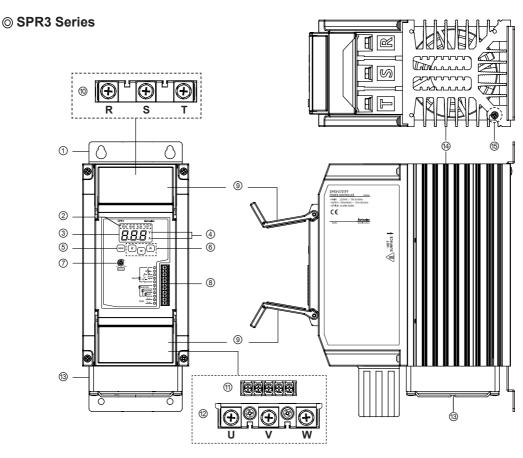

Indicator		Color	Function
RUN	Operation indicator	Green LED	Turns on in the RUN mode.
MAN	Manual control indicator	Green LED	Turns on when adjusting load output in the manual control mode.
ALM	Alarm indicator	Red LED	Flashes in alarming status.
OUT	Output indicator	Red LED	Turns on when load control outputs.

- ③ Display part: Displays settings of the front display [d+5] parameter in RUN mode, and displays parameter and setting value in setting mode.
- ④ Unit indicator (♦: Light ON/●: Light OFF)

Indicator		Dianlay	
V	Α	Display	
•		Resistance, load	
≎	•	Voltage	
•	Þ	Current	
≎	≎	Power	

- (5) em key: Enters parameter group, returns to RUN mode, moves parameters, and saves the setting value.
- ⑤ Setting value adjustment key: Enters SV setting mode and move digits.
- ① Output limit adjuster (OUT ADJ): Limits output from 0 to 100%.
- ® 11-pin connector terminal
- 9 Terminal cover
- $\ensuremath{\texttt{0}}\xspace$ Alarm output and power input terminals
- 1 R, S, U load output terminals
- @ Cooling fan: For models with the rated load current of 70A/100A/150A, a cooling fan is attached.
- Heatsink
- (M4) Bolt for grounding (M4)

Dimensions

SPR1 Series

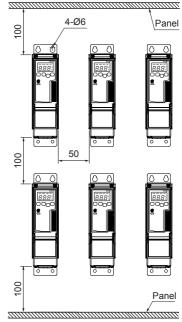

Rated load current 25A/35A/50A

• Rated load current 70A

⊚ Spacing

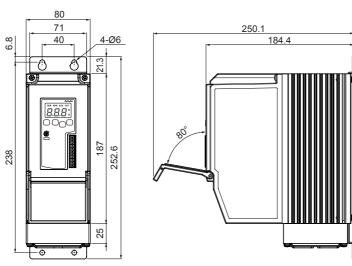

When installing multiple power controllers, please keep space at least 50mm in horizontal and 100mm in vertical between power controllers for heat radiation.

While supplying power to the load or right after turning off the power of the load, do not touch the body and heatsink. Failure to follow this instruction may result in a burn due to the high temperature.

• Rated load current 100A/150A

		Inside/outside adjuster		E_1	Load output [%] = Inside adjuster [%] × Outside adjuster [%]	

Control Method

O Phase control

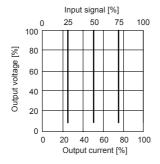

Normal control mode

It is general output method to divide control angle proportionally according to control input signal and to output it.

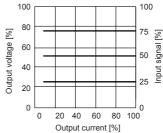

• Constant current feedback control mode

If temperature coefficient of load (platinum, molybdenum, tungsten, etc) changes 6 to 12 times based on room temperature, it outputs constant current which is proportion to control input not to change output voltage for power supply variation, load resistance variation.

• Constant voltage feedback control mode

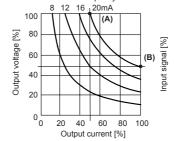

At low temperature coefficient load(iron, chrome, nichrome, etc) of electrical resistance, it outputs constant output which is proportion to control input not to change output voltage for power supply variation, load resistance variation.

Constant power feedback control mode

It is proper control method for a heater which resistance value variation by silicon carbide (SiC) heating is big. It outputs constant power which is proportion to control input even though load variation and power supply variation.

Output characteristics is proper 50% of the curve which connects the point (A) [output voltage 100% × output current 50%] and the point (B) [output voltage 50% × output current 100%]. The current output capacity of this unit should be over two times of load capacity.

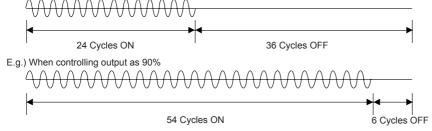

O Cycle control

• Fixed cycle control mode

During fixed cycle (60 cycles) of load power, it repeats ON/OFF cycle as constant ratio according to control input signal and controls the power supplies on the load.

E.g.) When controlling output as 40%

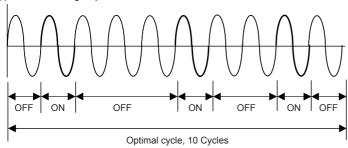

I-40 Autonics

Variable cycle control mode

Variable cycle control controls required power using min. cycles of load power according to control input signal and optimize temperature changes of the subject.

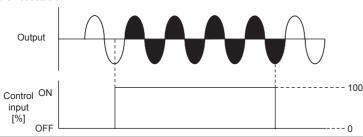

E.g.) When controlling output as 30%

ON/OFF control

This is control method that output is 100% at control input ON (approx. 18mA, min. 4.5VDC), and 0% at control input OFF (approx. 18mA, max. 4.5VDC).

When using ON/OFF control method, output limit, SOFT START, SOFT UP/DOWN, input correction, and input slope correction functions
are not setable.

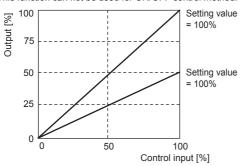

Functions

Output limit (OUT ADJ)

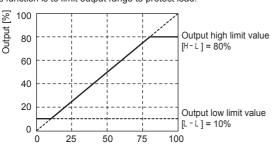

This function will be [Control input (%) \times OUT ADJ (%) = Output] and it controls the power supplied into the load. Although control input is 100% (5V or 20mA), the output is the 50% which is proportioned with OUT ADJ.

*This function can not be used for ON/OFF control method

Output high limit/low limit value [H-L/L-L]

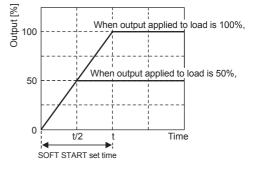

This function is to limit output range to protect load

© SOFT START [5-₺]

When the power is supplied, this function is able to protect the load when it controls load (molybdan, white gold, infrared lamp) with inrush current or the width of rising temperature in big (SV is big). SOFT START set time (T) is the required time that output reaches to 100%, and it is differentiated by OUT ADJ set value. %This function can not be used for ON/OFF control method.

This function can not be used for ON/OFF control method.

SPR1/SPR3 Series

SOFT UP/DOWN [U- Ŀ /d- Ŀ]

Unlike SOFT START which operates only once at supplying power, this function protects load from the inrush current in the RUN mode. When reached to the target output value, operation stops. XThis function can not be used for ON/OFF control method.

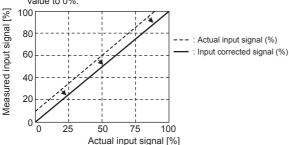

A: SOFT START function finished.

B: SOFT UP function finished.

C: SOFT DOWN function finished.

It compensates the offset between actual input value and measured input value.

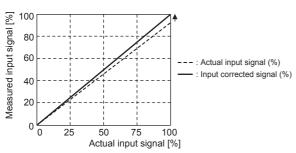

E.g.) When the input monitoring value is 5% at 4mA in DC4-20mA control input, setting ¹ nb to -5 calibrates the input monitoring value to 0%.

It compensates the gain of the measured 100% input for actual 100% input value.

Calibrated monitoring value=Monitoring value+ $\frac{\text{Monitoring value}}{100-5Pn} \times 5Pn$

E.g.) When the input monitoring value is 99% at 4mA in DC4-20mA control input, setting 5 Pn to 1 calibrates the input monitoring value to 100%.

RUN/STOP switching

RUN/STOP status of the power controller can be switched with the external RUN/STOP contact. In the RUN mode, the operation indicator on the front turns on.

AUTO/MANUAL selection

Operation mode (auto control/manual control) of the power controller can be selected with the external AUTO/MAN contact. In the manual control mode, the manual control indicator on the front turns on.

© RESET

In the event of system anomalies and alarms, RESET input restarts the power controller.(Parameters are not initialized.) Or, hold the ☑, ☒ keys for 2 sec, to operates RESET.

O Alarm

Tumo	Display		Operation	Clear alarm		
Туре	Error Priority		Alarm Output		Oleai aidilli	
SCR error alarm ^{*1}	SCr	1				
Overcurrent alarm ^{*1}	۵-۲	2			Re-supply the powerRESETSwitch to STOP mode	
Heatsink overheat alarm	ŁEń	4	Error messege flashes.Alarm indicator	Output stops. (SCR OFF)		
Overvoltage alarm ^{*1}	o-n	5	(ALM) flashes. • Alarm output			
Fuse break alarm	FUS	3	turns ON		Automatically cleared when	
Heater break alarm ^{*1}	Н-Ь	6		Continues operation	returning within the setting range	

X1:This is only for feedback control models.

When multiple alarms occur at the same time, the highest priority
error message will be displayed based on priority.

1) SCR error alarm

Even though output is 0%, if the current of 10% or more of the rated load current flows for over 3 sec continuously, SCR error alarm occurs

2) Overcurrent alarm

This function protects the load from overcurrent.

If the current flows over the overcurrent alarm setting value $[\Box \mathcal{L} \ \sqcup \]$ and setting delay time $[\Box \mathcal{L} \ \vdash \]$, overcurrent alarm occurs.

3) Heatsink overheat alarm

When the temperature of a heatsink is over 85°C, heatsink overheat alarm occurs.

4) Overvoltage alarm

This function protects the load from overvoltage.

If the current flows over the overvoltage alarm setting value [pub] and setting delay time [pub], overvoltage alarm occurs.

5) Heater break alarm

Comparing the full load resistance value and the current load resistance value, if the current load resistivity is maintained under the setting value [Hbu] for over 3 sec continuously, heater break alarm occurs. This alarm operates when control output is over 10% and load current is over 10% of the rated current. Output does not stop and operates normally.

Current load resistivity(%) = $\frac{\text{Full load resistance value}}{\text{Current load resistance value}} \times 100$

This function recognizes the load resistance value automatically. Turning on this function operates the load with 100% of output for approx. 3 sec and sets the load resistance value in the product automatically.

XThis is only for feedback control models.

RMS display/control

SPR Series measures and displays RMS value for maintaining accuracy.

E.g.) At pure resistance load, when control input is 4-20mA, rating is 220V or 50A.

Control input	4mA	8mA	12mA	16mA	20mA	Unit
Amount of control input	0	25	50	75	100	%
Display voltage (normal control mode)	0	66	155	2 10	550	V
Display voltage (constantvoltage feedback control mode)	0	55	110	165	550	V
Display current (constantcurrent feedback control mode)	0	12	25	38	50	Α

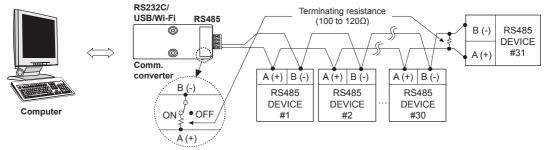

■ RS485 Communication Output

※Applicable for models with RS485 communication output through option output (SPR□-□□T□□).
Please refer to '■ Ordering Information'.

© Communication Specifications

Comm. protocol	Modbus RTU	Comm. speed	2400, 4800, 9600, 19200, 38400 bps
Connection method	RS485	Comm. response time	5 to 99ms (default: 20ms)
Application standard	Compliance with EIA RS485	Start bit	1-bit (fixed)
Max. connections	31 units (address: 1 to 99)	Data bit	8-bit (fixed)
Synchronization method	Asynchronous	Parity bit	None, Even, Odd
Comm. method	Two-wire half duplex	Stop bit	1-bit, 2-bit
Comm. distance	Max. 800m		

O Application of system organization

※It is recommended to use Autonics communication converter; SCM-WF48 (Wi-Fi to RS485·USB wireless communication converter, sold separately), SCM-US48I (USB to RS485 converter, sold separately), SCM-38I (RS232C to RS485 converter, sold separately). Please use twisted pair wire, which is suitable for RS485 communication, for SCM-WF48, SCM-US48I and SCM-38I.

Proper Usage

- 1. Follow instructions in 'Cautions during Use'. Otherwise, it may cause unexpected accidents.
- 2. Use the product, after 3 sec of supplying power.
- 3. Before use, set the mode and function according to the specification.
 - Especially, be cautious that the product does not operate when OUT ADJ. is set to 0%. Since changing the mode/ parameter during operation may result in malfunction, set the mode and function after disconnecting load output.
- 4. Re-supply the power to the unit after the unit is discharged completely. Failure to follow this instruction may result in malfunction.
- 5. To ensure the reliability of the product, install the product on the panel or metal surface vertically to the ground.
- 6. Install the unit in the well ventilated place.
- 7. While supplying power to the load or right after turning off the power of the load, do not touch the body and heat sink. Failure to follow this instruction may result in a burn due to the high temperature.
- 8. Install a power switch or circuit breaker in the easily accessible place for supplying or disconnecting the power.
- 9. Do not wire to terminals which are not used.
- 10. Since inter element can be damaged when using with coil load, inductive load, etc., the inrush current must be under the rated load current.
- 11. Do not use near the equipment which generates strong magnetic force or high frequency noise.
- This unit may be used in the following environments.
 - 1 Indoors (in the environment condition rated in 'Specifications')
 - 3 Pollution degree 2
- ② Altitude max. 2,000m ④ Installation category III
